

CASE STUDY: **CHELSEA CREEK**

CONSTRUCTION

BRIEF

Chelsea Creek had 4 requirements:

1. Installation of Urmet iPervice Intercom
2. Installation of Urmet iPervice Access Control System
3. Installation of American Dynamics IP CCTV System
4. Installation of Fibre Links & Wireless Transmission System

SOLUTION

1. UPSCALE

With one of the largest luxury residential developments in Fulham, a fully IP intercom system was implemented. The security systems were installed by the Ansador projects team succeeded the installation working closely with the St George technical team.

2. MONITOR COSTS

Due to the size of the project, Ansador specified and integrated both Fibre Links and radio transmission across the development. Employing Wavesight radio links, data communication was enabled from remote areas and across the development there allowing a suitable platform on which to implement the security systems specified.

CHALLENGES

With an expansive community being created, it was imperative that IP CCTV be strategically implemented with cameras being implemented right across the board. The American Dynamics system was installed in tandem with radio links already prepared by Ansador networking engineers, the on site teams were able to deploy and commission cameras even in the most remote areas with data being transmitted to the central network video recording station.

3. BESPOKE SYSTEM

An Urmet iPervoice intercom and access control system were integrated across the development operating across a well-engineered network. With all hardware being addressed in house, the installation of the systems was seamless offering a reduced time on site and ultimately offering a cost saving to the client.

RESULT

-  Integrated intercom and card access system offering full control of the entire site wide access control systems.
-  Fibre and radio links offering efficient and immediate data transmission allowing for real time monitoring of security systems.
-  American Dynamics CCTV system offering concierge real time visibility of communal and perimeter areas with improved analytics to aid in reducing administration.
